

AssentTag - Complete Feature Guide & Source Code

1. NumPy Linear Algebra (np.linalg)

np.linalg is the core mathematical engine for biometric verification. It calculates the 128D Euclidean distance between faces.

2. Financial Override PIN (6-Digit OTP)

Source File: login/views.py

This logic monitors chat for keywords like 'transfer' or 'pay' and intercepts them with a PIN requirement.

```
def chat(request, user_id):
    # ... keyword detection ...
    if is_financial:
        otp = '123456' # HARDCODED PIN FOR DEMO
        request.session['financial_otp'] = otp
        # ... sends failsafe email to d:/AssentTag/emails/ ...
```

3. Tap to Hold (Ghost Text Decryption)

Source File (Template): temp/templates/temp/dashboard.html

Source File (Logic): temp/views.py

Ghost text is only visible while the user holds their finger/mouse on the screen. This prevents unauthorized screenshots.

```
<div class='ghost-text-container'
onmousedown='decryptGhostText(this, ...)'
onmouseup='encryptGhostText(this)'
ontouchstart='decryptGhostText(this, ...)'>
<h2>SECURE DECRYPT: HOLD TO READ</h2>
</div>
```

4. Complaint & Admin Reply System

Source File: complaint/views.py

```
def add_reply(request, idd):
    if request.method == 'POST':
        obj = Complaint.objects.get(complaint_id=idd)
        obj.reply = request.POST.get('admin_reply')
        obj.save()
```

5. Explore Feed (User Discovery)

Source File: temp/views.py

```
def explore_feed(request):
    # Exclude self and hibernated users
    all_users = Register.objects.exclude(register_id=ss).exclude(status='hibernated')
    return render(request, 'temp/explore_feed.html', {'all_users': all_users})
```

6. Messaging (Chat Protocol)

Source File: login/views.py

```
class Message(models.Model):
    content = models.TextField()
```

```
is_disappearing = models.BooleanField(default=False)
receiver = models.ForeignKey('Register', models.DO_NOTHING)
```

7. Story Persistence (24 Hour Filter)

Source File: temp/views.py

```
if current_time - s_dt <= timedelta(hours=24):
    if s.register_id not in stories_dict:
        stories_dict[s.register_id] = s
```

8. Followers & Mutual Verification

Source File: register/models.py

```
class Follower(models.Model):
    follower_user = models.ForeignKey('Register', ...)
    user = models.ForeignKey('Register', ...)
```
